# MICROPROCESSOR EARTH FAULT PROTECTION RELAY

## TYPE OPERATION MANUAL

### Addendum

For version with IRIG-B Time synchronization

 <b>Microelettrica Scientifica</b>	<b>IM30-B00</b>	Doc. N° MO-0239-ING

## INDEX

2.3.1 - Clock synchronization.	3
<b>7. DIGITAL INPUTS</b>	<b>3</b>
12.1 - PROGRAMMING OF FUNCTIONS SETTINGS	4
<b>17. CONNECTION DIAGRAM (SCE1946 Rev.0 Standard Output)</b>	<b>4</b>

## 2.3.1 - Clock synchronization.

The clock can be synchronized via the IRIG-B digital input (terminals 1 – 14) or the serial communication interface. By programming the variable ( $T_{syn} = 5', 10', 15', 30', 60', \text{IRIG-B, Dis}$ ) the Synchronization is made in different ways :

- $T_{syn} = \text{Dis}$  : The current date can only be modified manually either via the front panel keyboard (SETTING MENU) or via the serial communication interface (programming mode).
- $T_{syn} = \text{IRIG-B}$  : The clock is automatically updated by the IRIG-B input signal.
- $T_{syn} = 5', 10', 15', 30', 60'$  : The clock is updated via the serial interface as follows

The unit expects to receive a sync signal at the beginning of every hour and once every  $T_{syn}$  minutes. When a sync signal is received, the clock is automatically set to the nearest expected synchronization time.

For example: if  $T_{syn}$  is 10min and a sync signal is received at 20:03:10 January the 10<sup>th</sup>, 98, then the clock is set to 20:00:00 January the 10<sup>th</sup>, 1998. On the other hand, if the same sync signal were received at 20:06:34, the clock would be set to 20:10:00, January the 10<sup>th</sup> 98.

Note that if a sync signal is received exactly in the middle of a  $T_{syn}$  period, the clock is set to the previous expected synchronization time.

## 7. DIGITAL INPUTS

Three digital inputs are provided: they are active when the relevant terminals are shorted

- **B2** (terminals 1 - 2) : it blocks the operation of the time delayed elements t1I and t2I.
- **B3** (terminals 1 - 3) : it blocks the operation of the time delayed elements t3I.
- **B4** (terminals 1 - 14) : Another optoisolated input is available for a IRIG-B time Synchronisation input from GPS – Accuracy 10ms – Time Synchronization can also be made via serial communication interface (see § 2.3.1)  
**ATTENTION!**  
Connection of a GPS system to the IRIG-B input must be made through a proper adapter device supplied on request as optional.
- **B4** (terminals 1 - 44) : Switching-over from Setting Program 1 (SP1) to Setting Program 2 (SP2)
  - Terminals 1 – 44 Open = Setting Program 1 active
  - Terminals 1 – 44 Shorted = Setting Program 2 active

The input B4 can also be activated via the serial communication port. In this case Switching-back from SP2 to SP1 can only be made via serial port. Viceversa if the terminals 1 – 44 are shorted, switching-back from SP2 to SP1 cannot be made via the serial port.

When a function is blocked the pick-up of its time delayed output is inhibited. Programming allows to have the inhibition either permanent as long as the blocking input is active ( $tB2=\text{Dis}$ ;  $tB3=\text{Dis}$ ) or automatically removed after the expiry of the set trip time delay of the function involved plus an additional time  $2tBF$  ( $tB2=2tBF$ ;  $tB3=2tBF$ ). By proper interconnection of the blocking inputs and outputs of different relays it is possible to configurate very efficient arrangements of logic fault discrimination as well as to feature a safe and quick breaker back-up protection.
